

ADAPT

Stop studying harder. **Start studying your way.**

An AI learning agent that discovers how you learn — and continuously changes how it teaches.

example-based

visual reasoning

active recall

teach-back

questioning

Same content. **Wrong method.**

Student: "I understand it when I see examples." **System:** *"Read this explanation."*

Student: "I need to be challenged." **System:** *"Here are 10 easy questions."*

Student: "I thought I understood it." **System:** *"Next chapter."*

Education adapts the curriculum. It rarely adapts the **teaching methodology.**

So ADAPT asks a different question: **How should THIS student be taught THIS concept, right now?**

TRADITIONAL AI

ADAPT

Learning DNA + a closed feedback loop

Your Learning DNA

A live, evolving profile of which teaching strategies produce real evidence of understanding — not a fixed trait, continuously updated.

The Core Loop

○ Discover

Short diagnostic interactions

○ Teach

AI selects a teaching methodology

○ Observe

Reads hesitation, errors, teach-back

○ Adapt

Switches example, modality, difficulty

○ Remember

Reinforces with active recall

The glow-up: from studying harder to studying smarter

Why it should work

- Built on established learning science (worked examples, active recall, teach-back) — not a new pedagogy, a faster way to apply it
- Closes the loop on evidence of understanding, not just content coverage, so friction gets caught in the same session
- Personalizing the method compounds: each interaction sharpens the next teaching decision

	Before	After
Teaching style	Fixed for everyone	Adapts per student, per concept
When stuck	Student self-corrects, or quits	System detects friction, switches method
Done when	Content is covered	Understanding is shown

Who's using it. Who's paying for it.

Target users

Students in high school, college, and self-directed exam prep who are motivated but stuck on specific concepts — paid for directly, or bundled through tutoring centers and schools.

Alternatives today

Private tutors — Effective, but expensive and hard to schedule

Generic AI chatbots — Answer questions, don't track or adapt method

Static practice apps — Adapt difficulty, not teaching style

Our edge: personalizes the teaching method itself, plugs into existing content libraries instead of replacing them, and costs a fraction of 1:1 tutoring.

Market size (illustrative estimate)

Alternative	Pricing model
1:1 human tutor	\$40–80 / hour
Tutoring platform subscription	\$20–40 / month
ADAPT (target)	\$10–15 / month

From prototype to pilot in 90 days

0–30 DAYS

Build the core loop

- Single subject, single concept
- Diagnostic + basic adapt logic
- Closed test with ~10 students

30–60 DAYS

Expand & instrument

- Grow the strategy library
- Tune signal extraction
- Structured pilot with metrics

60–90 DAYS

Pilot with a partner

- Add 2nd–3rd subject
- Onboard a school or tutoring center
- Dashboard on success metrics

Resources needed:

2 engineers

1 learning-science advisor

1 PM / designer

LLM API budget

\$15k–40k / 90 days

Risks + mitigations

Signal misreads confusion as disengagement → Combine behavioral signals with brief explicit check-ins

Real-time adaptation gets expensive at scale → Cache common explanation variants; small model for signal, large only for generation

Students distrust an AI that changes strategy → Make the switch visible — tell the student why it's adapting

The so-what slide

Business model

\$10–15/month direct-to-student subscription, plus a per-seat license for tutoring centers and schools that embed ADAPT into their existing programs.

Back-of-envelope impact

If adaptive teaching cuts time-to-mastery meaningfully, a student needs fewer supplemental tutoring hours — at \$40–80/hr, even a couple of hours saved covers many months of ADAPT.

Pilot proposal

Scope: one subject, one cohort

Duration:
6–8 weeks, 50–100 students

Success:
measurable gain in mastery time and retention vs. a control group

Success metrics

Time to mastery Minutes to demonstrated understanding per concept

Retention rate Delayed recall accuracy, 1–2 weeks later

Session completion % of sessions finished without dropping off

Engagement / NPS Return usage and student satisfaction

Cost per concept mastered Total cost ÷ concepts mastered

This isn't another AI tutor.

It's an AI that learns how to teach you.

ADAPT builds a living model of how each student learns, and reshapes teaching in real time to match it — turning study time into actual understanding.

The ask: a 6–8 week pilot with one cohort to prove the mastery and retention gains.

- **ADAPT**
